

Hydro Electricity

Hydroelectricity is a form of renewable energy that uses the power of moving water to generate electricity. It works by directing flowing or falling water through turbines, which spin and activate a generator to produce electricity. Most hydroelectric power comes from dams built across rivers, where water is stored and released in a controlled way. One major benefit of hydroelectricity is that it produces less pollution than fossil fuels. It is also a reliable and consistent energy source, especially in areas with lots of rainfall or large rivers. Additionally, hydroelectric dams can help control flooding and store water for irrigation and drinking.

Key Words: (3-5 words per sentence)

1. _____, _____, _____, _____, _____
2. _____, _____, _____, _____, _____
3. _____, _____, _____, _____, _____
4. _____, _____, _____, _____, _____
5. _____, _____, _____, _____, _____
6. _____, _____, _____, _____, _____

Paragraph Re-Write
